

Radiation Protection Dosimetry in Pulsed Fields

Oliver Hupe

Hayo Zutz and Jana Klammer

Introduction: Pulsed Radiation Fields

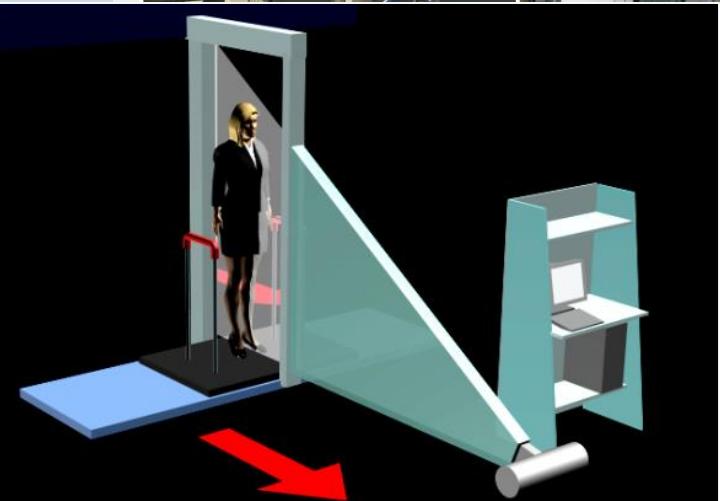

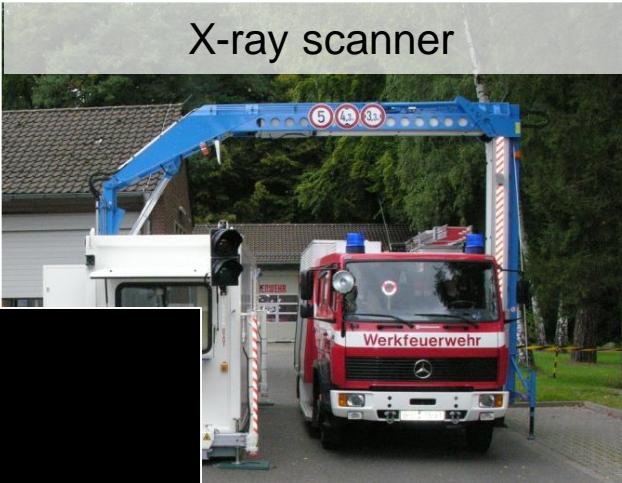

- Application of pulsed fields increased remarkably

Germany:
about 70 % of 340 000 occupational exposed workers in pulsed fields

Introduction: Pulsed Radiation Fields

- Application of pulsed fields increased remarkably
- ... can be produced as a pulsed field or can appear pulsed for the dosimeter
- “Pulsed”: duration less 10 s

X-ray diagnostics

Science and material testing

- Application of pulsed fields increased remarkably
- ... can be produced as a pulsed field or can appear pulsed for the dosimeter
- “Pulsed”: duration less 10 s
- Dosemeters are only tested in continuous fields
- Characteristics of dosemeters determined in cont. fields can't be transferred to those in pulsed fields
- Electronic dosemeters could measure considerably wrong, or even fail completely in pulsed fields

U. Ankerhold, O. Hupe and P. Ambrosi:

Deficiencies of active electronic radiation protection dosimeters in pulsed fields
Radiation Protection Dosimetry Vol. 135, No. 3, pp. 149-153 (2009)

Electronic dosimeters in pulsed fields

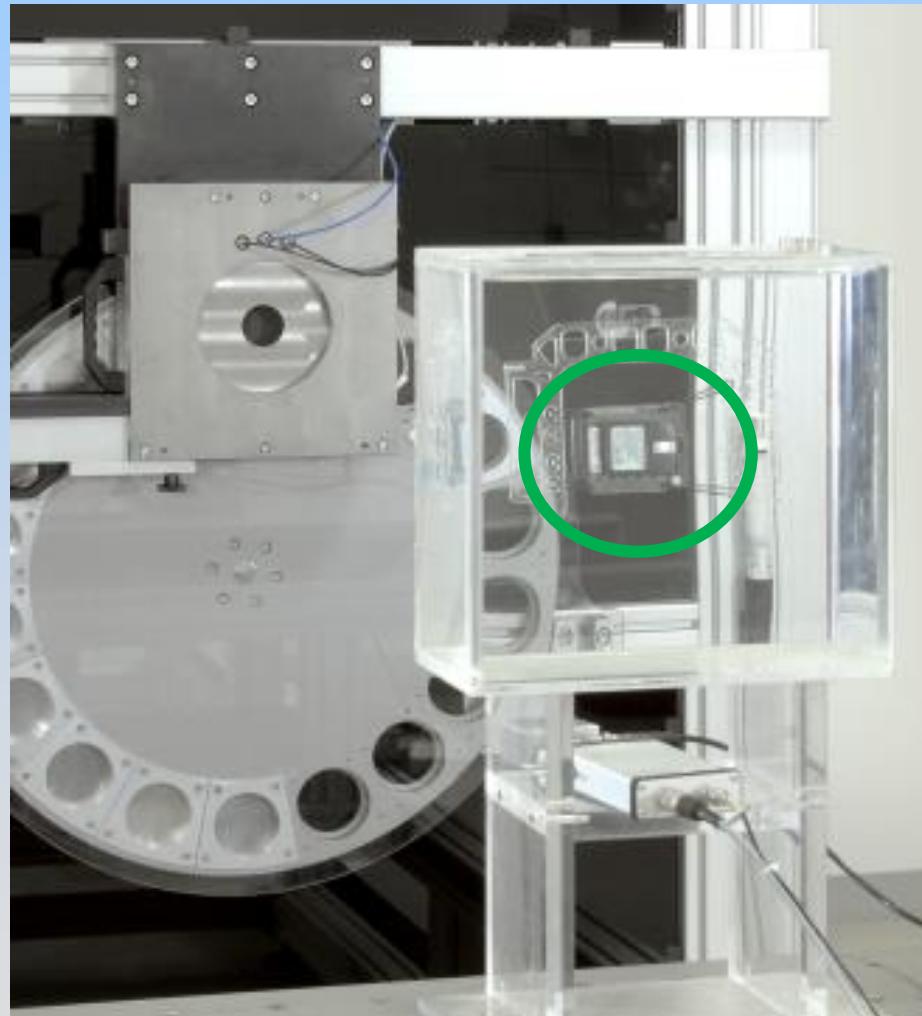

Let's see what happens ...

Electronic dosimeters in pulsed fields

Pulsed X-ray fields at PTB

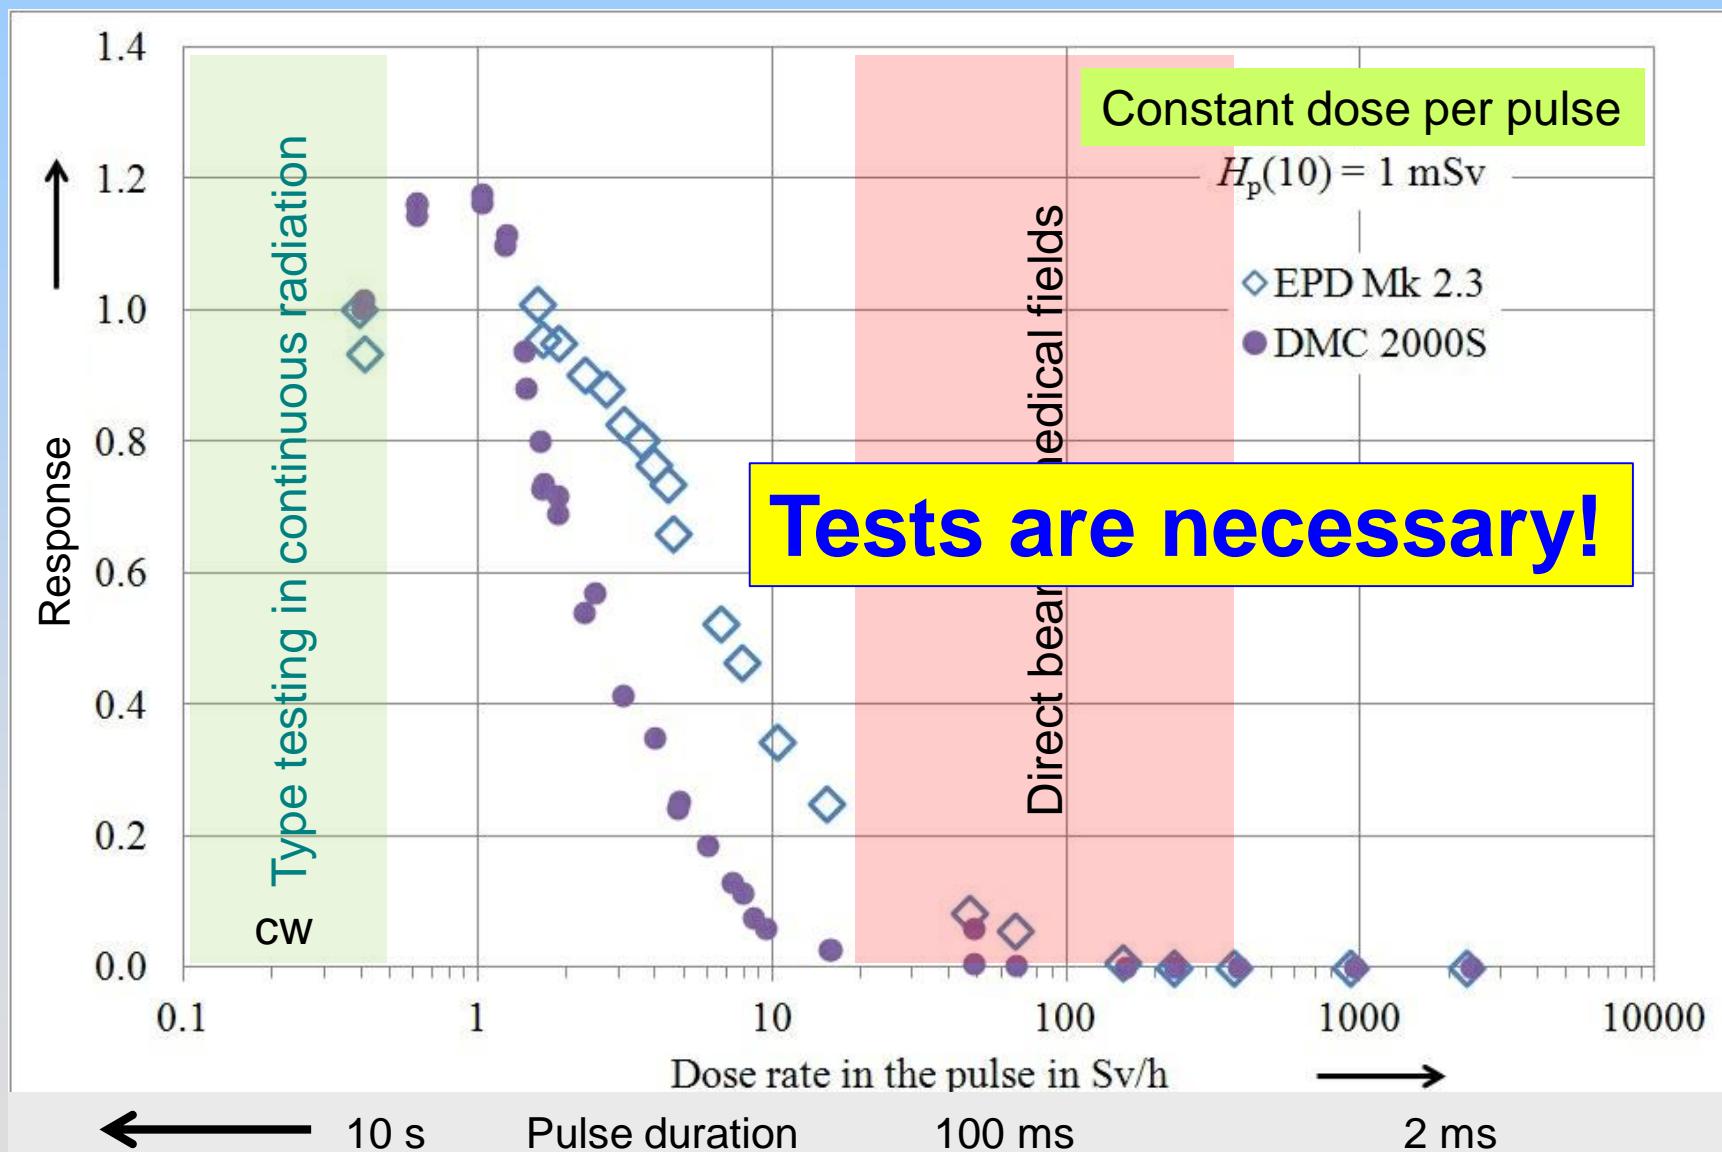

Let's see what happens ...

Typical electronic personal dosimeters
(results also valid for area dosimeters!)

Electronic dosimeters in pulsed fields

Electronic personal and area dosimeters

PTB

- Detector: e.g. Semiconductor, GM-tube
- Measuring mode: **counting**
- Dose rate range: **50 nSv/h - 1 Sv/h**
- Properties:
 - ✓ direct indication
 - ✓ adjustable alarm function
 - limited dose rate range

Examples:

Reasons for problems in pulsed fields

- **dead time** of the detector/electronics
 - > correcting algorithms assume a constant dose rate during the measuring cycle (several seconds)

Novel pulsed X-ray reference fields at PTB

Important field parameters:

- Tube voltage U_{tube} 40 kV to 125 kV
- Tube current I_{tube} 0.5 mA to 800 mA
- Pulse duration t_{pulse} 0.2 ms to cw
- Frequency f_{pulse} up to 100 Hz

Characterisation of a radiation pulse:

Time-resolved measurement of

- dose
- dose rate
- high voltage during the radiation pulse

Characterisation: Measurement of pulse dose

PTB

Radiation produced charge could be in the order of those produced by other influences

Next step: Standardisation

International
Organization for
Standardization

&

ISO 18090 TS: “Radiological Protection – Characteristics of reference pulsed radiation”

- Based on concept of ISO 4037: Adequate reference fields for testing instead of diverse workplace fields
- No definition of new radiation qualities necessary
- Definition and description how to measure the relevant parameters, e.g.
 - pulse duration
 - pulse dose rate
 - dose per radiation pulse

Financially supported by

IEC 62743 TS: “Radiation Protection Instrumentation – Electronic counting dosemeters for pulsed fields of ionizing radiation”

- The concept is similar to that used for other influence quantities:
 1. Determination of the dosimeter's parameter range
 2. Parameter range of the pulsed workplace field must be known
 3. User has to judge if the dosimeter can be used

H. Zutz, O. Hupe, P. Ambrosi and J. Klammer:

Determination of relevant parameters for the use of electronic dosimeters in pulsed fields of ionizing radiation, RPD, doi: 10.1093/rpd/ncs027 (2012)

P02.275
Zutz, H.

Summary

- Electronic personal and area dosimeters may measure considerably wrong or even fail completely in pulsed fields
- Novel reference field for pulsed X-ray at PTB
- ISO 18090 TS “Radiological Protection – Characteristics of reference pulsed fields” (started)
- IEC 62743 TS “Radiation Protection Instrumentation – Electronic counting dosimeters for pulsed fields of ionizing radiation” (finished this year)
