

# CORPORE: a Tool for Interpreting Whole Body Monitoring Results

P. Croüail, C. Croteau, L. Skuterud

---

**Session TS10b:** *Existing exposure situations due to accidental contamination and nuclear legacy - long term management and remediation*

14 May 2012

# Questions and worries of exposed people

## ■ Different cultures – Same questions and worries

- In Belarus: people living in the vicinity of the Chernobyl exclusion zone
- In Norway: Sami people affected by Chernobyl consequences on the reindeer breeding
- In Japan: people living in non-evacuated areas after the Fukushima accident

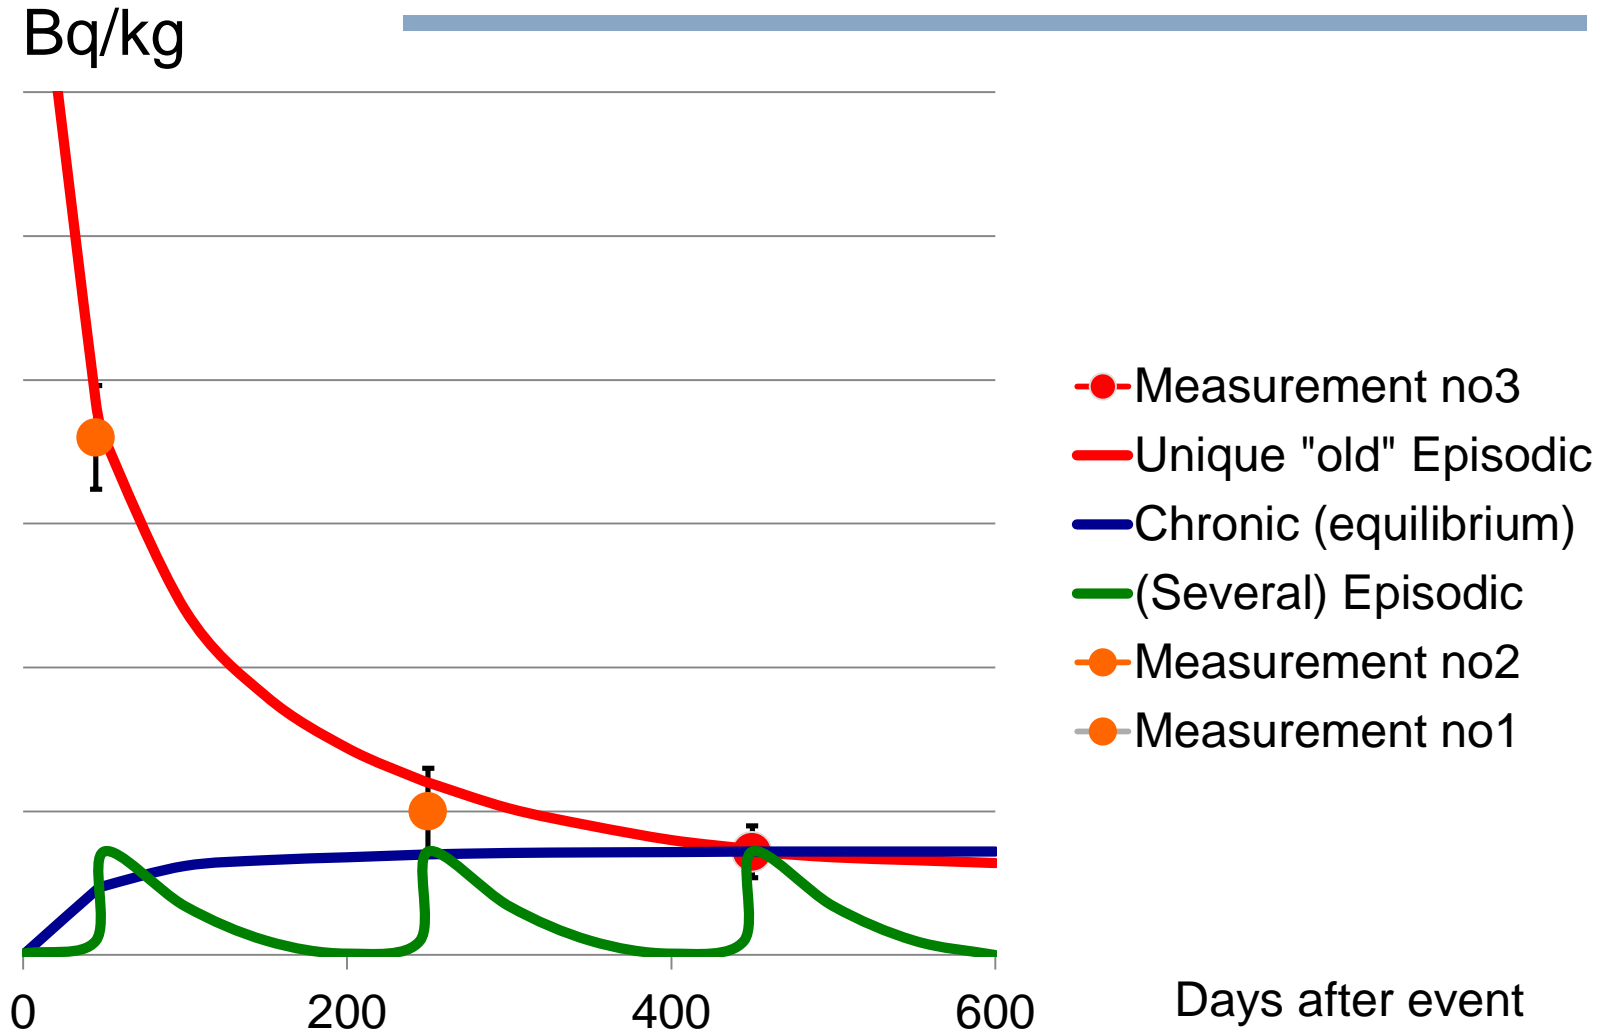

# Questions and worries of exposed people (2)

- *Am I contaminated? What is the dose? When and where am I exposed? Is it harmful? Why are my children more contaminated than their friends? What can I do to improve the situation?*

- Local 'experts' (e.g. medical doctors) cannot answer to individual concerns; they don't have tools for interpreting WBC measurements; it generates a feeling of helplessness and a loss of trust

# Compatibility of contamination profiles with WBC measurements

# What is the dose received?

- The 'experts' do not know!

Episodic 'small'  
contamination(s)?

How many?  
When?

Unique  
« old » and high  
contamination?

Chronic (daily)  
contamination?

**Error up to a factor of 100!**

**Is it acceptable with regard to  
the reference levels?**

**0.1 mSv  $\neq$  10 mSv !**

# How to reduce uncertainties? (1)

- By increasing the frequency of measurements
  - Expensive
  - Intrusive
  - Scarcity of measurement resources

Age of the exposed person	Number of (Cs-137) WBC measurements needed to reduce the possible error on effective dose (by less than a factor of 3)
<b>5 years old</b>	<b>12 /year</b>
10 years old	6 /year
15 years old	3 /year
<b>Adult</b>	<b>&gt; 2 /year</b>

## How to reduce uncertainties? (2)

- By establishing a dialogue with the exposed people during the measurement
  - to better know the **individual profiles** of internal contamination
  - to improve the radiological protection culture within families (identification of self-help protection actions)

- Specific diets of the family members
- Hobbies and episodic behaviours
- Life places
- Contamination levels of local food products

# CORPORE 1st module

Name	Gender	Birth		
Child n°1	Man	01/12/2000		
Measures				
date	weight	activity in Bq	in Bq/Kq	in Bq/day
01/04/2007	25	2590	103,60	
01/07/2007	25	4500	180,00	48,91
01/10/2007	25	3050	122,00	16,58
*				

# Conclusion and Perspectives

---

- From the prototype to a software
  
- Toward an Expert System?
  - Design of self help protection actions
  - Strategy of health surveillance
  - Training of local professionals
  - Epidemiological studies (database)
  
- Development of CORPORE in Japan
